

Tutorial at Modelica'2011: Using the MDT-ModelicaML Eclipse Plugin for Modelica Development and UML-Modelica Systems Engineering.

by

Wladimir Schamai (EADS) and Adrian Pop (LIU)

Bring your laptop –hands-on exercises

The OpenModelica MDT (Modelica Development Tooling) Eclipse plugin and UML profile for Modelica, named ModelicaML, is presented in this tutorial, including hands-on exercises.

The ModelicaML UML profile is an open-source implementation being developed by the Open Source Modelica Consortium (www.openmodelica.org). It is based on the OMG UML and reuses concepts from the SysML (Systems Modeling Language) profile and required for system specification. UML diagrams are also extended to support all Modelica constructs. With ModelicaML system engineers are able to specify entire systems, starting from requirements, continuing with behavior and finally perform system simulations based on the Modelica simulation technology and standard libraries.

MDT is primarily aimed at development of large Modelica models or libraries. It has support for browsing, editing, code completion, type information in popup windows, automatic indentation, model refactoring, building executables, and debugging (debugging currently only for MetaModelica). It also allows simulation and plotting from a special command window. Thus it provides a rather complete integrated development environment, and it is also the first available Eclipse plugin for an equation-based language. It is currently used regularly for Modelica model development as well as for development of the OpenModelica compiler.

A presentation of MDT/ModelicaML, its integration in Eclipse, and a demonstration will be given. Workshop participations will be able to install the software and use it for some hands-on exercises.

Notes:

The Unified Language (UML) has been created to assist software development processes by providing means to capture software system structure and behavior. This has evolved into the main standard for Model Driven Development in software modeling.

The System Modeling Language (SysML) is a graphical modeling language for systems engineering applications. SysML was developed by systems engineering experts, and was adopted by OMG in 2006. SysML is built on top of UML and tailored to the needs of system engineers by supporting specification, analysis, design, verification and validation of broad range of systems and system-of-systems.

ModelicaML is a graphical notation that is based on the OMG UML and which reuses SysML concepts (e.g. Requirement). It extends the UML/SysML and is designed towards generation of executable Modelica code to be simulated using Modelica simulation tools. ModelicaML is currently implemented as an UML profile using the Eclipse UML2 technologies. This allows usage of the ModelicaML Profile in any Eclipse-based UML/SysML tool, such as Topcased or PapyrusUML.

Short Biographies

Adrian Pop is currently working with model-driven development tools, including the OpenModelica compiler, the ModelicaML profile, and the MDT Eclipse plugin. He is currently technical coordinator at the Open Source Modelica Consortium and is also part-time at Linköping University. He received a PhD on the topic of Integrated Model-Driven Development Environments from Linköping University in 2008.

Wladimir Schamai is a researcher in the Systems Engineering department of EADS Innovation Works (the corporate research center of the EADS company) and a PhD student at the Linköping University. After studying computer science he has been a performing software developer for few years. Since 2005, he is actively involved in research concerning Model-Based Systems Engineering. He is a member of INCOSE and OMG.

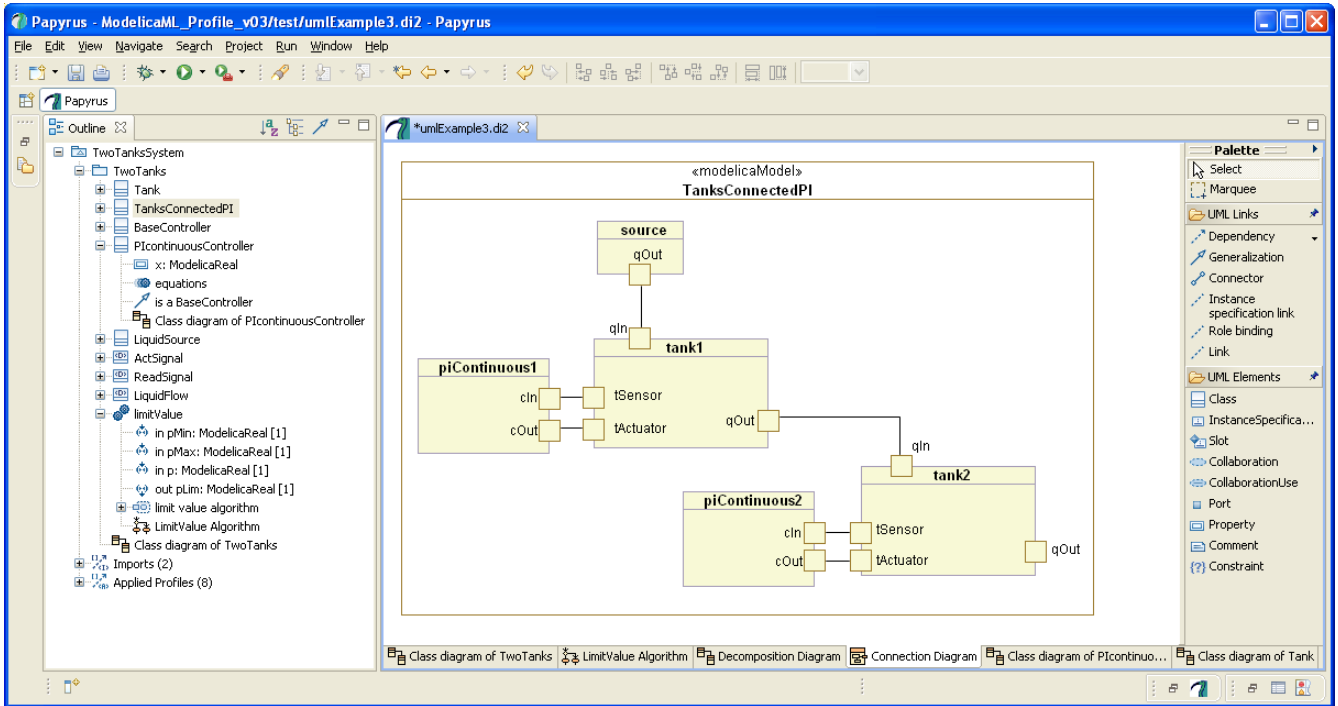

Figure 1: Example of a ModelicaML model in PapyrusUML modeling tool

```

1  within TwoTanks;
2
3  model TanksConnectedPI
4    LiquidSource source(flowLevel = 0.02);
5    Tank          tank1(area = 1);
6    Tank          tank2(area = 1.3);
7    PIcontinuousController piContinuous1(ref = 0.25);
8    PIcontinuousController piContinuous2(ref = 0.4);
9
10   equation
11     connect(source.qOut, tank1.qIn);
12     connect(tank1.tActuator, piContinuous1.cOut);
13     connect(tank1.tSensor, piContinuous1.cIn);
14     connect(tank1.qOut, tank2.qIn);
15     connect(tank2.tActuator, piContinuous2.cOut);
16     connect(tank2.tSensor, piContinuous2.cIn);
17   end TanksConnectedPI;

```

The screenshot shows the Modelica Development Tooling (MDT) interface. The main window displays the Modelica code for 'TanksConnectedPI.mo'. The code defines a model within the 'TwoTanks' package. It includes a 'LiquidSource' component 'source' with 'flowLevel = 0.02', two 'Tank' components 'tank1' (area = 1) and 'tank2' (area = 1.3), and two 'PIcontinuousController' components 'piContinuous1' (ref = 0.25) and 'piContinuous2' (ref = 0.4). The 'equation' block contains six 'connect' statements: 'connect(source.qOut, tank1.qIn);', 'connect(tank1.tActuator, piContinuous1.cOut);', 'connect(tank1.tSensor, piContinuous1.cIn);', 'connect(tank1.qOut, tank2.qIn);', 'connect(tank2.tActuator, piContinuous2.cOut);', and 'connect(tank2.tSensor, piContinuous2.cIn);'. The left sidebar shows a project tree with 'TwoTanks' containing various Modelica files like 'ActSignal.mo', 'BaseController.mo', 'LiquidFlow.mo', 'LiquidSource.mo', 'PIcontinuousController.mo', 'Tank.mo', and 'TanksConnectedPI.mo'. The right sidebar shows an 'Outline' view with 'TwoTanks.TanksConnectedPI' containing 'piContinuous1', 'piContinuous2', 'source', 'tank1', and 'tank2'. The bottom status bar shows 'Writable', 'Insert', and '8 : 51'.
